3.2 Describe the requirements of a workplace label.

Workplace labels are created and used when:

- the hazardous product is transferred to a new container from the supplier container
- the supplier label is missing or unreadable and a supplier replacement label is not available
- a product is made and used onsite.

Required information on a workplace label includes:

- product name (matching the name on the safety data sheet (SDS) of the product)
- safe handling precautions, which may include pictograms or other supplier information
- reference to the SDS (if available)

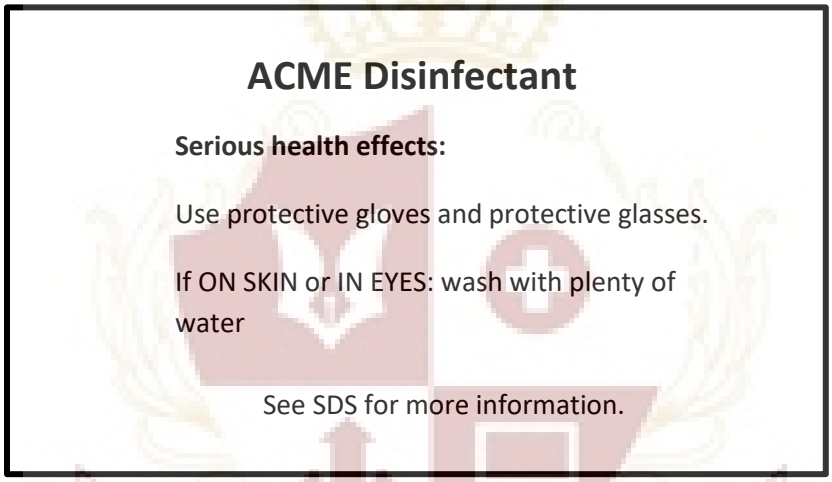

Figure 3: Example of Workplace Label

It is the responsibility of both the employer and the worker to ensure that proper workplace labels are placed on hazardous products when needed.
